

ODOR-ELIMINATION PROTOCOL

Malodor control and elimination is one of the most difficult problems confronting cleaning professionals today. Customers and patrons experience and interact with your facility through smell first. The smell of a facility communicates the quality and cleanliness of that space to a customer. Before treating any malodor, ensure you have a product scientifically proven to eliminate malodors, not just mask them. In order to control odor in your facility, follow these key steps:

1. To remove daily odors from the air

Step 1: If a soil is present, spray odor-elimination product near the soil to make cleaning more pleasant.

Step 2: Remove the soil if present.

Step 3: Remove any remaining odor from the air by starting in the area farthest from the exit to the room and spraying odor-elimination product into the air with a side-to-side sweeping motion while moving toward the exit until the whole room is treated.

2. To remove daily odors from soft surfaces

Step 1: If a soil, gross filth and/or a stain is on the soft surface, spray odor-elimination product on the soil to make cleaning more pleasant.

Step 2: Remove the soil.

Step 3: Spray the soft surface until slightly damp with odor-elimination product to remove any remaining odor on the soft surface.

Step 4: Remove any remaining odor from the air by starting in the area farthest from the exit to the room and spraying odor-elimination product into the air with a side-to-side sweeping motion while moving toward the exit until the whole room is treated.

3. To remove recurring odors from the air

Step 1: Set spray interval to about 25 minutes (this timing will vary depending on the cabinet used) and insert metered odor-elimination product according to the cabinet instructions.

Step 2: Install the dispensing cabinet high on a wall near the source of the recurring odor.

Step 3: Check cabinet in 30 days and refill as necessary.
